The probability that the lifetime of an exponentially distributed random variable exceeds the expected lifetime $= \frac{1}{e}$, irrespective of the parameter λ . Therefore, for $\lambda = 2$, $\Pr(X > E(X)) = \frac{1}{e}$.
Answer: 0.37

QUESTION

The lifetime of a component of a certain type is a random variable whose probability density function is exponentially distributed with parameter 2. For a randomly picked component of this type, what is the probability that its lifetime exceeds the expected lifetime (rounded to 2 decimal places) ?

SOLUTION

Given, The lifetime of a component $X \sim \exp(2)$. The probability density function (PDF) of random variable X is given by:

$$f_X(x) = \begin{cases} \lambda e^{-\lambda x}, & \text{for } 0 < x < \infty \\ 0, & \text{otherwise} \end{cases} \quad (0.0.1)$$

where: the parameter $\lambda = 2$. Since, the PDF of the random variable is exponentially distributed, Expected Lifetime $= E(X) = \frac{1}{\lambda} = \frac{1}{2} = 0.5$

$$\Pr(X > E(X)) = \int_{\frac{1}{\lambda}}^{\infty} \lambda e^{-\lambda x} dx \quad (0.0.2)$$

$$= -e^{-\lambda x} \Big|_{\frac{1}{\lambda}}^{\infty} \quad (0.0.3)$$

$$= \lim_{x \rightarrow \infty} (-e^{-\lambda x}) - (-e^{-\lambda \times \frac{1}{\lambda}}) \quad (0.0.4)$$

$$= \frac{1}{e} \quad (0.0.5)$$

$$= 0.36787944117 \quad (0.0.6)$$
