QUESTION

Let X_1, X_2, \dots be independent random variables with X_n being uniformly distributed between $-n$ and $3n$, $n=1,2,\dots$. Let $S_N = \frac{1}{\sqrt{N}} \sum_{n=1}^N \frac{X_n}{n}$ for $N=1,2,\dots$ and let F_N be the distribution function of S_N . Also, let ϕ denote the distribution function of a standard normal variable. Which of the following is/are true?

- A) $\lim_{N \rightarrow \infty} F_N(0) \leq \phi(0)$
- B) $\lim_{N \rightarrow \infty} F_N(0) \geq \phi(0)$
- C) $\lim_{N \rightarrow \infty} F_N(1) \leq \phi(1)$
- D) $\lim_{N \rightarrow \infty} F_N(1) \geq \phi(1)$

SOLUTION

Given, X_1, X_2, \dots are independent random variables with $X_i \sim \mathcal{U}(-i, 3i)$. Let us define:

$$Y_i = \frac{X_i}{i} \quad \forall i \quad (0.0.1)$$

$$\Rightarrow Y_i \sim \mathcal{U}(-1, 3) \quad (0.0.2)$$

Now, Y_1, Y_2, \dots are i.i.d (independent and identically distributed) uniform random variables.

Definition 1. The probability density function of a uniformly distributed continuous random variable in the interval $[a, b]$ is

$$f_X(x) = \begin{cases} \frac{1}{b-a}, & \text{for } a \leq x \leq b \\ 0, & \text{otherwise} \end{cases} \quad (0.0.3)$$

Lemma 0.1. For a uniformly distributed continuous random variable in the interval $[a, b]$, the mean and variance are given by:

$$\mu = \frac{a+b}{2} \quad (0.0.4)$$

$$\sigma^2 = \frac{(b-a)^2}{12} \quad (0.0.5)$$

Proof.

$$E(X) = \int_{-\infty}^{+\infty} x f_X(x) dx \quad (0.0.6)$$

$$\mu = \int_{-\infty}^a 0x dx + \int_a^b \frac{1}{b-a} x dx + \int_b^{+\infty} 0x dx \quad (0.0.7)$$

$$= 0 + \frac{1}{b-a} \left(\frac{x^2}{2} \right) \Big|_a^b + 0 \quad (0.0.8)$$

$$= \frac{b^2 - a^2}{2(b-a)} = \frac{a+b}{2} \quad (0.0.9)$$

$$E(X^2) = \int_{-\infty}^{+\infty} x^2 f_X(x) dx \quad (0.0.10)$$

$$E(X^2) = \int_{-\infty}^a 0x^2 dx + \int_a^b \frac{1}{b-a} x^2 dx + \int_b^{+\infty} 0x^2 dx \quad (0.0.11)$$

$$= 0 + \frac{1}{b-a} \left(\frac{x^3}{3} \right) \Big|_a^b + 0 \quad (0.0.12)$$

$$= \frac{b^3 - a^3}{3(b-a)} = \frac{a^2 + ab + b^2}{3} \quad (0.0.13)$$

$$\sigma^2 = E(X^2) - [E(X)]^2 \quad (0.0.14)$$

$$= \frac{a^2 + ab + b^2}{3} - \left(\frac{a+b}{2} \right)^2 \quad (0.0.15)$$

$$= \frac{(b-a)^2}{12} \quad (0.0.16)$$

□

Using (0.1), we get:

$$\mu = \frac{-1+3}{2} = 1 \quad (0.0.17)$$

$$\sigma^2 = \frac{[3 - (-1)]^2}{12} = \frac{16}{12} = \frac{4}{3} \quad (0.0.18)$$

And, we have:

$$S_N = \frac{1}{\sqrt{N}} \sum_{n=1}^N \frac{X_n}{n} \quad (0.0.19)$$

$$= \frac{1}{\sqrt{N}} \sum_{n=1}^N Y_n \quad (0.0.20)$$

Theorem 0.1 (Central Limit theorem). *Let X_1, X_2, \dots, X_n be i.i.d random variables with finite μ and σ^2 . If Z_n is defined as*

$$Z_n = \frac{1}{\sqrt{n}} \sum_{i=1}^n X_i \quad (0.0.21)$$

Then,

$$\lim_{n \rightarrow \infty} Z_n \sim \mathcal{N}(\mu, \sigma^2) \quad (0.0.22)$$

By (0.1), we can conclude:

$$\lim_{N \rightarrow \infty} S_N \sim \mathcal{N}(\mu, \sigma^2) \quad (0.0.23)$$

$$\implies \lim_{N \rightarrow \infty} F_N(x) = \phi\left(\frac{x - \mu}{\sigma}\right) \quad (0.0.24)$$

$$= \phi\left(\frac{\sqrt{3}(x - 1)}{2}\right) \quad (0.0.25)$$

Substituting $x=1$, we get:

$$\lim_{N \rightarrow \infty} F_N(1) = \phi\left(\frac{\sqrt{3}(1 - 1)}{2}\right) \quad (0.0.26)$$

$$= \phi(0) \quad (0.0.27)$$

The distribution function F_N is non-decreasing. So,

$$\lim_{N \rightarrow \infty} F_N(0) \leq \lim_{N \rightarrow \infty} F_N(1) = \phi(0) \quad (0.0.28)$$

$$\lim_{N \rightarrow \infty} F_N(0) \leq \phi(0) \quad (0.0.29)$$

The distribution function ϕ is non-decreasing. So,

$$\lim_{N \rightarrow \infty} F_N(1) = \phi(0) \leq \phi(1) \quad (0.0.30)$$

$$\lim_{N \rightarrow \infty} F_N(1) \leq \phi(1) \quad (0.0.31)$$

Answer: Option (A) and (C)
